Topic Introduction :

A Library Management System is a software built to handle the primary housekeeping functions of a library. Libraries rely on library management systems to manage asset collections as well as relationships with their members. Library management systems help libraries keep track of the books and their checkouts, as well as members' subscriptions and profiles.

Library management systems also involve maintaining the database for entering new books and recording books that have been borrowed with their respective Publisher.

Introduction to ASP.Net

- ASP.NET is a web development platform, which provides a programming model, a comprehensive software infrastructure and various services required to build up robust web applications for PC, as well as mobile devices.
- ASP.NET is a part of Microsoft .Net platform. ASP.NET applications are compiled codes, written using the extensible and reusable components or objects present in .Net framework. These codes can use the entire hierarchy of classes in .Net framework.
- The ASP.NET application codes can be written in any of the following languages:
 - ☐ C#
 - ☐ Visual Basic.Net
 - ☐ Jscript
 - ☐ J#

ASP.NET is used to produce interactive, data-driven web applications over the internet. It consists of a large number of controls such as text boxes, buttons, and labels for assembling, configuring, and manipulating code to create HTML pages.

Why do we use C#?

Programming in C#: Since the C# is a lot similar to other widely used languages syntactically, it is easier to code and learn in C#. Programs can be written in C# in any of the widely used text editors like Notepad++, gedit, etc. or on any of the compilers. After writing the program save the file with the extension .cs

Feature

Easy to start : C# is a high-level language so it is closer to other popular programming languages like C, C++, and Java

Widely used for developing Desktop and Web Application : It is one of the most popular languages that is used in professional desktop. If anyone wants to create Microsoft apps, C# is their first choice.

Community : C# has a large community so the developments are done to make it exist in the system and not become extinct.

Game Development : C# integrates with Microsoft and thus has a large target audience. The C# features such as Automatic Garbage Collection, interfaces, object-oriented, etc. make C# a popular game developing language

What is ASPX used for?

Default.aspx - The default webpage loaded when a client browser requests a Web server directory on a Microsoft IIS-based server that uses ASP.NET. For example, when a client requests `http://www.sampledomain.com/`, the server loads `http://www.sampledomain.com/Default.aspx`, unless it is configured to load a different file.

Using Default.aspx in our project we Designing our web page

What is Default.aspx.cs used for?

The **Default.aspx.cs** page allow programmer to write c# programming code to develop website application.

What is the purpose of master page?

- Master pages allow you to create a consistent look and behavior for all the pages (or group of pages) in your web application.
- A master page provides a template for other pages, with shared layout and functionality. The master page defines placeholders for the content, which can be overridden by content pages. The output result is a combination of the master page and the content page.
- The content pages contain the content you want to display.
- When users request the content page, ASP.NET merges the pages to produce output that combines the layout of the master page with the content of the content page.
- The master page above is a normal HTML page designed as a template for other pages.
- The **@ Master** directive defines it as a master page.
- The master page contains a placeholder tag **<asp:ContentPlaceholder>** for individual content.
- The **id="CPH1"** attribute identifies the placeholder, allowing many placeholders in the same master page.
- This master page was saved with the name **"master1.master"**

```

OUTPUT

The screenshot displays a web application interface with three main sections for book inventory management:

- Add Book Inventory:** A form with input fields for Book ID, Book Name, Book Publisher Name, Book Published Year, Book Price, and Book Quantity.
- Edit Book Inventory:** A form with input fields for Book ID, Book Name, Book Publisher Name, Book Published Year, Book Price, and Book Quantity. It includes a "Check" button next to the Book ID field.
- Delete Book Inventory:** A form with a single input field for Book ID.

At the top of the page, there are navigation links: **ADD**, **EDIT**, and **DELETE**. At the bottom, there are action buttons: **ADD**, **RESET**, and **CANCEL**. The interface is styled with a light blue header and footer, and the main content area has a white background with blue borders.

OUTPUT

1st page:

Adding information of book in Add Book Inventory

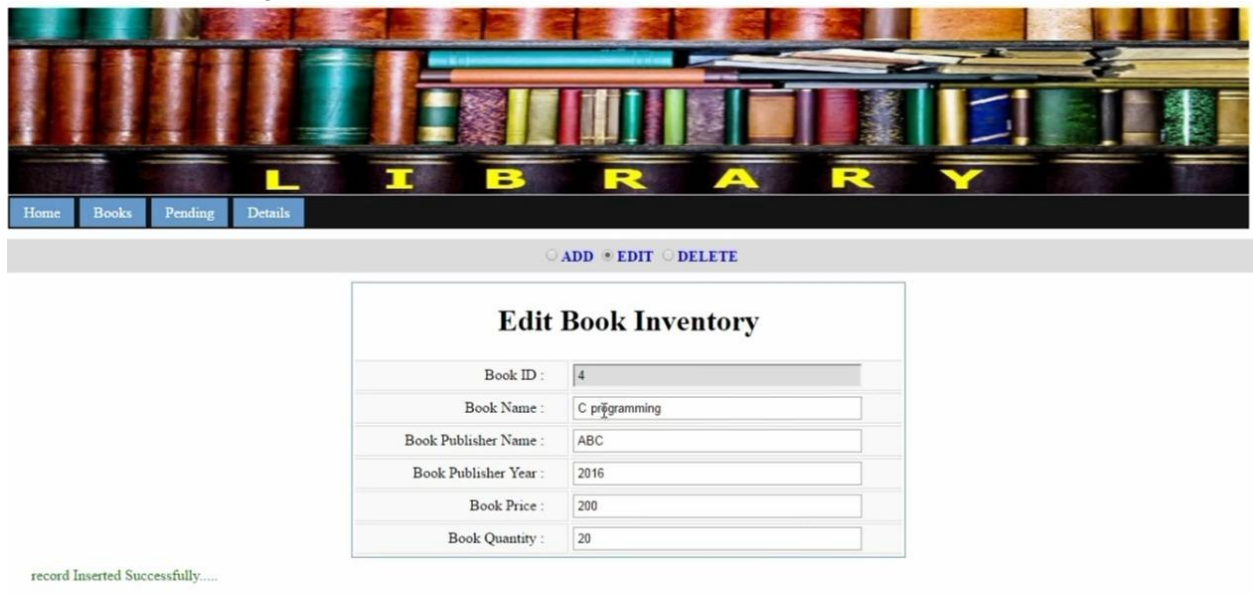

The screenshot shows a web application interface for a library. At the top, there is a header with the word "LIBRARY" in large, yellow, outlined letters. Below the header is a navigation bar with buttons for "Home", "Books", "Pending", and "Details". A secondary navigation bar contains radio buttons for "ADD", "EDIT", and "DELETE", with "ADD" selected. The main content area is titled "Add Book Inventory" and contains a form with the following fields:

Book ID :	4
Book Name :	C programming
Book Publisher Name :	ABC
Book Published Year :	2016
Book Price :	200
Book Quantity :	20

Below the form are three buttons: "ADD" (highlighted in red), "RESET", and "CANCEL".

Page 2nd:

Successfully stored data of book

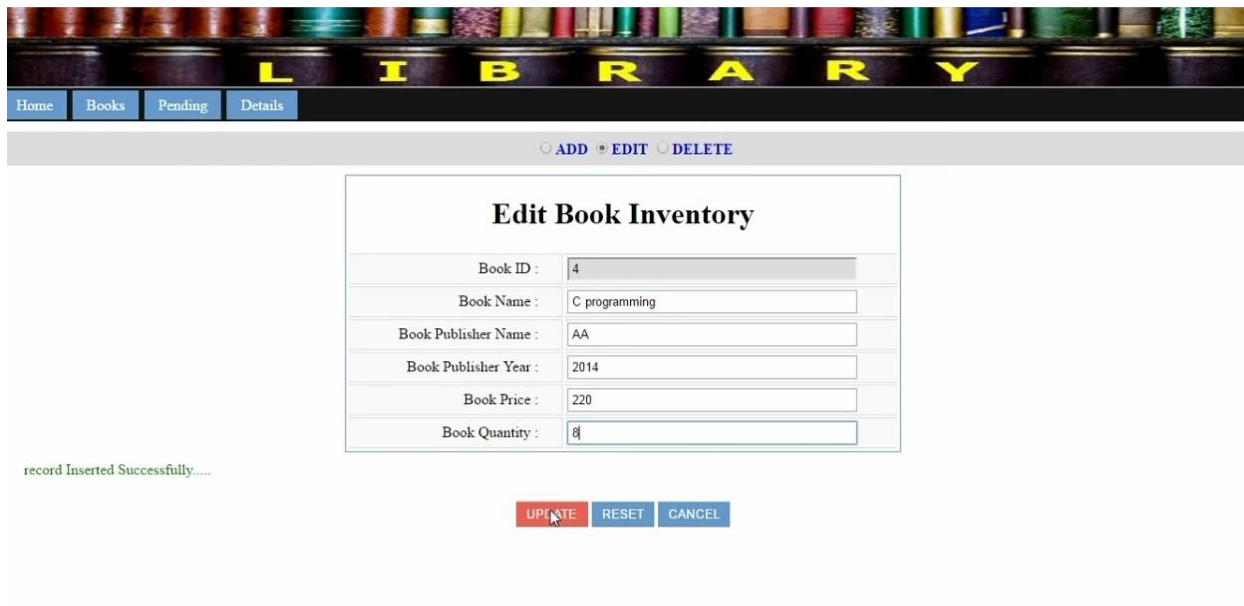

The screenshot shows the same web application interface, but the "EDIT" radio button is now selected. The main content area is titled "Edit Book Inventory" and contains the same form as the previous page, with the following fields:

Book ID :	4
Book Name :	C programming
Book Publisher Name :	ABC
Book Published Year :	2016
Book Price :	200
Book Quantity :	20

Below the form, a green message states: "record Inserted Successfully.....".

If User wants to update data, they can easily update

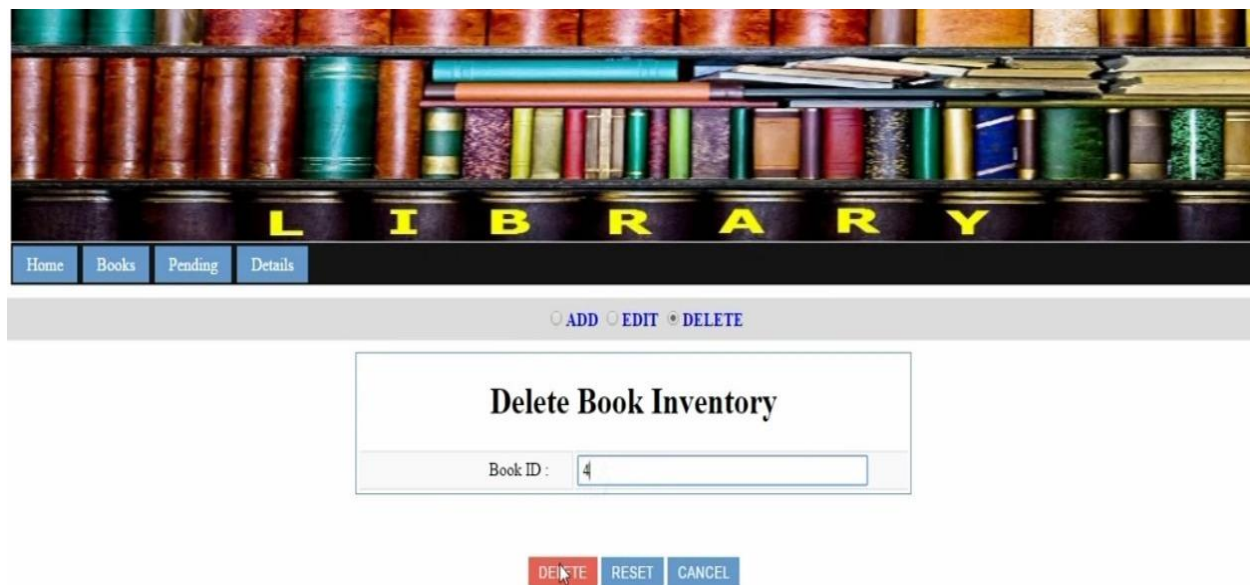

The screenshot shows a web application interface for a library. At the top, there is a header with a bookshelf image and the word 'LIBRARY' in large yellow letters. Below the header is a navigation bar with buttons for 'Home', 'Books', 'Pending', and 'Details'. A secondary navigation bar contains radio buttons for 'ADD', 'EDIT' (which is selected), and 'DELETE'. The main content area features a form titled 'Edit Book Inventory'. The form contains the following fields:

Book ID :	4
Book Name :	C programming
Book Publisher Name :	AA
Book Publisher Year :	2014
Book Price :	220
Book Quantity :	8

Below the form, a green message states 'record Inserted Successfully.....'. At the bottom of the form area are three buttons: 'UPDATE' (highlighted in red), 'RESET', and 'CANCEL'.

Page :3rd

If User wants to Delete data they can easily update

The screenshot shows the same web application interface as the previous one, but with the 'DELETE' radio button selected in the secondary navigation bar. The main content area features a form titled 'Delete Book Inventory'. The form contains a single field:

Book ID :	4
-----------	---

Below the form are three buttons: 'DELETE' (highlighted in red), 'RESET', and 'CANCEL'.
